India’s sovereign green bonds,
and what the label was actually worth.

Auction-level evidence, FY2022-23 to FY2025-26

India’s Sovereign Green Bonds: Did Investors Actually Pay a Premium for Green?
Neil Sangwaiya · 8 August 2026 · Independent research note

SUMMARY

Across seven auctions where a conventional Government of India comparator could be matched, India’s sovereign green bonds priced an average of **2.0 basis points** below the conventional curve. The programme has therefore lowered the government’s borrowing cost, but by an amount worth roughly **₹29 crore a year** against an interest bill of ₹9.28 lakh crore. The more consequential finding is how that pricing was held: between May 2024 and June 2025 the Reserve Bank cancelled two green auctions outright, truncated a third, and let two more devolve on primary dealers, leaving a ₹10,302.602 crore shortfall in the year’s green borrowing.

What this note contains. A 1,300-word analysis, seven exhibits, the full auction dataset, the greenium calculation for every observation, a methodology statement, source list, and an explicit list of limitations and claims that require further verification before they are relied upon.

Research integrity. Every numerical claim is either taken from a named primary source or is arithmetic performed on such a source, and is labelled accordingly in Appendix E. Where data could not be verified, the note says so rather than estimating. No yield, allocation or auction figure in this document has been inferred, reconstructed or filled in.

KEY FINDINGS

1. Mean and median greenium of **+2.0 basis points** across seven matched observations; **+1.75 bps** once weighted by the amount actually placed with investors.
2. The greenium reached zero in late 2023. The 5-year auction of 10 November and the 10-year auction of 8 December both priced at exactly the interpolated conventional yield.
3. The two largest 10-year greeniums came with the worst auction outcomes: 28 per cent of the August 2024 issue sold, and 70 per cent of the November 2024 issue devolved on primary dealers.
4. The only clean, fully-placed positive observation was the 30-year on 13 December 2024, at +4.7 bps. Tenor, not the label, is the variable that separates success from failure.
5. In FY2024-25 less than a fifth of notified 10-year green issuance reached investors. All of the 30-year did.
6. Proceeds went overwhelmingly to clean transportation, and a single line item, electric locomotive production at ₹9,928.99 crore, is 48 per cent of the FY2023-24 programme.
7. There is no evidence of additionality, and the framework never required it. In both reported years the government spent more on eligible schemes than the bonds raised and funded the excess from general revenue.
8. The FY2023-24 allocation report contradicts itself: its chart shows renewable energy at ₹6,116.3 crore, its detailed table ₹4,578.47 crore.

India got its greenium. It just had to stop selling bonds to keep it.

On 31 May 2024 the Reserve Bank of India offered ₹6,000 crore of 10-year sovereign green bonds. Investors bid about twice that. The RBI sold nothing. Two months later it tried again with the same notified amount and accepted ₹1,697 crore, roughly 28 per cent. By the end of that financial year the government’s dated securities programme was short by ₹10,302.602 crore, and both the Clearing Corporation of India and the Finance Ministry’s own debt reports pin the shortfall on green bond auctions where the greenium on offer was too low.

I went into this expecting to find out whether India’s green bonds priced below the conventional curve. They did, a bit. What I did not expect was that the number would matter so much less than how it was obtained.

I started from the Department of Economic Affairs’ Public Debt Management quarterly reports, which publish every dated security auction with its date, notified amount, amount raised, devolvement on primary dealers, cut-off price and cut-off yield. That gives me the green bond side and the conventional side from one primary source, on identical terms. For each green bond auction I picked the nearest-maturity conventional Government of India security, took its cut-off yield at the auction immediately before and immediately after, interpolated linearly to the green bond’s auction date, and subtracted.

Seven auctions produced a usable comparison. Mean greenium: **+2.0 basis points**. Median: also **+2.0**. Weighted by the amount actually placed with investors rather than pushed onto primary dealers, it drops to about **1.8 bps**.

That is not nothing, and it lines up with two independent sources. The Finance Ministry says the January and February 2023 debut issues went at a greenium of 2 to 6 bps. IEEFA puts India’s historical figure at 2 to 3 bps. My calculation lands inside both. When three different methods agree, I am reasonably confident the real number is small, positive, and in the low single digits.

Now the interesting part.

Figure 1. Greenium by auction date, in basis points. Positive values mean the green bond cleared below the conventional curve. Comparator yields are interpolated between the adjacent conventional auctions in the same maturity bucket. The two January and February 2024 observations sit either side of the interim Budget and are treated as low confidence in the statistics. **Source:** Ministry of Finance, Department of Economic Affairs, Public Debt Management Quarterly Reports, Statement 1. Author’s calculation.

Where the greenium went

In November and December 2023, in back-to-back auctions, the 5-year and 10-year green bonds both priced at exactly the interpolated conventional yield. Zero bps. Twice. The 5-year SGrB 2028 cleared at 7.25 per cent when the 7.37% GS 2028 was auctioned at 7.29 per cent a week earlier and 7.21 per cent a week later. The 10-year SGrB 2033 cleared at 7.24 per cent between conventional prints of 7.29 and 7.19. By the second year of the programme, the green label was worth zero on paper the market actually wanted to buy in size.

Then it got worse and better at the same time. The two largest 10-year greeniums I measured, 2.0 bps in August 2024 and 3.3 bps in November 2024, were bought at a price. In August the government sold 28 per cent of what it offered. In November it sold ₹5,000 crore on paper, but ₹3,498 crore of that devolved on primary dealers.

Figure 2. How the comparator is constructed, using the 13 December 2024 observation. The conventional 7.09% GS 2054 was not auctioned that day, so its yield is bracketed between the 6 December and 27 December auctions and interpolated. The gap to the green bond's cut-off is the greenium. **Source:** DEA Public Debt Management Quarterly Report, Q3 FY2024-25, Statement 1. Author's calculation.

Devolvement is worth explaining properly, because it is easy to misread. Primary dealers underwrite Indian government auctions. If the RBI decides the yields investors are demanding are too high, it accepts less than the notified amount and the balance goes to the underwriters at the cut-off. So devolvement does not mean nobody wanted the bonds. It means nobody wanted them at the price the government was willing to accept. The demand curve existed. It just sat above the reservation yield.

A cut-off yield is normally the market-clearing price for the full notified amount. When the issuer truncates the quantity, it stops being a clearing price and becomes a reservation price.

That reframes the entire measurement. You are no longer measuring what investors would pay. You are measuring what the government would accept. Every basis point of greenium calculated on a devolved or partially rejected auction is, strictly speaking, an upper bound.

There is direct evidence for this. IEEFA reports that at the cancelled May 2024 auction, bids came in 1 to 7 bps *above* the 6.99 per cent benchmark. At full size, in other words, the green bond carried a negative greenium. Investors wanted paying extra.

Figure 3. What each green bond auction actually placed. Bar length is the notified amount; segments show how it was resolved. Cancellation is not a demand failure: the May 2024 and June 2025 auctions drew roughly twice their notified amount in bids and were still declined. **Source:** DEA Public Debt Management Quarterly Reports; CCIL Debt Market Quarterly Q4 FY2024-25; Business Standard, 28 March 2025; IEEFA, 9 July 2025.

Tenor is the variable that matters

The one clean observation is the 30-year. On 13 December 2024 the 6.98% SGrB 2054 sold its full ₹5,000 crore at 6.98 per cent against an interpolated 7.0267 per cent on the 7.09% GS 2054. That is +4.7 bps, fully placed, no devolvement, no rejection. Insurers and pension funds buying 30-year duration have a genuine scarcity problem, and green paper at that maturity gives them something conventional supply does not. The government appears to have drawn the same conclusion: its H1 FY2025-26 borrowing calendar put green issuance entirely in the 30-year bucket.

Figure 4. In FY2024-25, less than a fifth of the notified 10-year green issuance reached investors. All of the 30-year did. This is the strongest single pattern in the dataset, and it is also the reason to be cautious about calling the result a green premium at all: a scarcity premium in long duration would produce the same signature. **Source:** DEA Public Debt Management Quarterly Reports; CCIL.

So what is it worth?

Take the top of my measured range, 5 bps, and apply it to the ₹57,697.4 crore raised across FY2022-23 to FY2024-25. That is about ₹29 crore a year of interest saved. Central government interest payments in FY2022-23 were ₹9.28 lakh crore. The green label is saving roughly three-thousandths of one per cent of the interest bill.

Figure 5. The four numbers in this study, drawn to scale by area. The saving the greenium generates is the dot in the corner of the largest square. **Source:** DEA Public Debt Management Quarterly Reports; CCIL. Saving figure is the author's calculation at the top of the observed greenium range.

Where the money went

The FY2023-24 allocation report is unusually specific, which makes it useful. Of ₹20,785.60 crore transferred, ₹16,087.99 crore (77.4 per cent) went to clean transportation, ₹4,578.47 crore (22.0 per cent) to renewable energy, and ₹119.14 crore (0.6 per cent) to the National Mission for a Green India. The single largest line is ₹9,928.99 crore for production of energy-efficient three-phase electric locomotives, which is 48 per cent of the whole programme.

Total ₹20,785.60 crore against ₹20,000 crore raised. The report’s own summary chart shows renewable energy at ₹6,116.3 crore; its detailed table totals ₹4,578.47 crore. Figures above follow the table, which reconciles to the stated total.

Figure 6. Scheme-level allocation of FY2023-24 proceeds. Category-level charts obscure the fact that one line item is nearly half the programme. **Source:** Ministry of Finance, Department of Economic Affairs, Sovereign Green Bonds Allocation Report FY 2023-24, Table 3.

Two things stand out. First, the report’s own summary chart shows renewable energy at ₹6,116.3 crore and 27 per cent, while its detailed table shows ₹4,578.47 crore and 22.0 per cent. A ₹1,537.83 crore gap between two figures in the same document is a reporting quality problem, not a scandal, but it is the kind of thing an investor doing diligence would flag.

Second, and more substantively: in both reported years the government spent *more* on eligible schemes than the bonds raised, and funded the excess from general revenue. ₹16,923 crore against ₹16,000 crore in FY2022-23. ₹20,785.60 crore against ₹20,000 crore in FY2023-24. Proceeds go into the Consolidated Fund of India and are allocated to metro equity injections, locomotive procurement, PM-KUSUM, rooftop solar and the Green India Mission, all of which were already budgeted.

That is not a breach of anything. India’s framework explicitly permits financing *and refinancing*. But it does mean the honest description is that the green bond re-labelled expenditure rather than creating it. Eligibility is demonstrated. Allocation is demonstrated. Additionality is not, and was never promised.

What CICERO actually said

CICERO Shades of Green rated the framework “Medium Green” with a “Good” governance score. Both terms are narrower than they sound. Medium Green in CICERO’s methodology means projects that represent significant steps towards the long-term vision but are not quite there yet. Good is the middle of three governance grades, below Excellent.

CICERO reviewed the framework document. Not the bonds, not the auctions, not the projects, not the outcomes. It graded renewable energy, energy efficiency, clean transportation and adaptation medium-to-dark green, and gave light or light-to-medium shading to sustainable water and waste management and to pollution prevention, because those categories were written broadly with no numerical thresholds. It also recommended an independent third-party audit of the controls over project selection, management of proceeds, and allocation and impact reporting.

A second party opinion tells an investor that the rulebook is credible. It says nothing about whether the rules were followed, and nothing about whether a tonne of carbon was avoided that would otherwise have been emitted. Treating it as proof of impact is a category error.

The judgement

India’s sovereign green bond programme has demonstrated that a rupee-denominated sovereign green curve can be built, sold, listed and reported on. It has produced a measurable financing advantage of roughly 2 basis points on average, concentrated at the long end and worth a rounding error against the sovereign interest bill.

It has not demonstrated that investors will pay a premium at scale. Four failed or truncated auctions between May 2024 and June 2025 are the market’s answer to that question, and the ₹10,302,602 crore borrowing shortfall is the price the Treasury paid for insisting. And it has not demonstrated additionality, because it was not designed to.

The case for continuing is real. It is just not the case that is usually made. The programme is worth running as market infrastructure: a benchmark curve, a domestic investor base, a reporting discipline that did not exist before. It is not worth running as a cheap funding strategy, because at 2 basis points it isn't one.

Appendix A · Full sovereign green bond auction record

FY2022-23 to FY2025-26. Amounts in ₹ crore.

Auction date	Security	Res. mat.	Notified	Raised	Devolved	Cut-off yield	Source
25 Jan 2023	7.10% SGrB 2028	5.00	4,000	4,000	0	7.10%*	PDM Q4 FY23

* The DEA quarterly report for Q4 FY2022-23 publishes cut-off yields to one decimal place only, so these four auctions cannot support a basis-point calculation from that source and are excluded from the statistics. **Data needed:** RBI full auction results for 25 January and 9 February 2023.
Totals FY2022-23 to FY2024-25: notified ₹68,000 crore, raised ₹57,697.398 crore, shortfall ₹10,302.602 crore, all of it in FY2024-25.

Appendix B · Greenium calculation, observation by observation

Greenium (bps) = comparator conventional yield – SGrB cut-off yield. Comparator is linearly interpolated between the nearest conventional auction before and after, in the same maturity bucket. All inputs from DEA Public Debt Management quarterly reports, Statement 1.

Auction	SGrB cut-off	Comparator	Prior auction	Next auction	Interpolated	Greenium	Confidence
10 Nov 2023 (5y)	7.25%	7.37% GS 2028	3 Nov: 7.29%	17 Nov: 7.21%	7.2500%	0.0	High
8 Dec 2023 (10y)	7.24%	7.18% GS 2033	1 Dec: 7.29%	15 Dec: 7.19%	7.2400%	0.0	High
19 Jan 2024 (30y)	7.37%	7.30% GS 2053	12 Jan: 7.41%	9 Feb: 7.14%	7.3425%	–2.8	Low
2 Feb 2024 (30y)	7.14%	7.30% GS 2053	12 Jan: 7.41%	9 Feb: 7.14%	7.2075%	+6.8	Low
2 Aug 2024 (10y)	6.90%	7.10% GS 2034	19 Jul: 6.98%	9 Aug: 6.89%	6.9200%	+2.0	High
29 Nov 2024 (10y)	6.79%	6.79% GS 2034	22 Nov: 6.86%	13 Dec: 6.75%	6.8233%	+3.3	High
13 Dec 2024 (30y)	6.98%	7.09% GS 2054	6 Dec: 7.01%	27 Dec: 7.06%	7.0267%	+4.7	High
31 Jan 2025 (10y)	7.0266–7.0735	Comparator yields not obtained				N/A	—
Q4 FY25 (30y)	7.0570–7.1168	Comparator yields not obtained				N/A	—

The two low-confidence rows sit either side of the 1 February 2024 interim Budget, which moved the long end sharply. Linear interpolation across a step change is not defensible, so they are reported but flagged.

Appendix C · Summary statistics

Statistic	All 7 observations	High-confidence 5
Mean greenium	+2.0 bps	+2.0 bps
Median greenium	+2.0 bps	+2.0 bps
Minimum	–2.8 bps	0.0 bps
Maximum	+6.8 bps	+4.7 bps
Positive spread	4 of 7 (57%)	3 of 5 (60%)
Zero or negative	3 of 7 (43%)	2 of 5 (40%)
Amount-weighted (market-placed)	—	+1.75 bps

Cross-check. The Ministry of Finance states the FY2022-23 debut issues carried a greenium of 2 to 6 bps. IEEFA states Indian sovereign green bonds have historically offered 2 to 3 bps. The independent calculation above sits inside both, using a method neither used.

Appendix D · Methodology and assumptions

- Single-source matching.** Green and conventional yields both come from DEA Public Debt Management quarterly reports, Statement 1, so both legs share one definition of “cut-off yield.”
- Comparator selection, in order:** closest residual maturity; same instrument characteristics (fixed coupon, SLR-eligible, repo-eligible, RBI-auctioned under the same notification); same issuance window. No cross-tenor comparisons were made.
- Linear interpolation** of the comparator between adjacent conventional auctions. Assumes the conventional yield moved smoothly between auction dates. Demonstrably false around the 1 February 2024 interim Budget, hence the confidence flags.
- Maturity matching, not duration matching.** Residual maturity gaps of up to 0.6 years are treated as second-order. The direction of bias is stated for each observation; on 13 December 2024 the green bond is 0.3 years longer on an upward-sloping curve, so +4.7 bps is conservative.
- Auction formats.** FY2023-24 5-year and 10-year green bonds used uniform-price auctions, the 30-year used multiple-price, and conventional benchmarks use multiple-price. Cut-off yields equal the marginal accepted yield under both formats and are treated as comparable. Weighted average yields are not comparable and have not been mixed in.
- Par issuance.** A new security with a cut-off price of 100.00 is taken to have a cut-off yield equal to its coupon.
- Censoring.** Where the RBI rejected bids or the issue devolved, the cut-off is not a clearing price for the notified amount, so the greenium is an upper bound rather than a measurement.
- The ₹29 crore figure** is static: 5 bps applied to face value, undiscounted, ignoring tranches that carried a smaller greenium or none.

Appendix F · Limitations, and claims requiring further verification

Limitations

- Auction cut-offs are not secondary market yields.** The textbook comparison uses the same-day secondary yield of a comparable conventional bond. Auction cut-offs embed auction-specific effects such as underwriting dynamics and supply size.
- Seven observations.** No statistical significance is claimed; these are descriptive statistics.
- FY2022-23 could not be independently recalculated** because that quarter’s report rounds to one decimal place. The Ministry’s own 2–6 bps statement is relied on and those auctions are excluded from the statistics.
- FY2024-25 Q4 and FY2025-26 are incomplete.** Comparator yields for the 31 January 2025 and Q4 FY25 auctions were not obtained, and the FY2025-26 picture rests on press and IEEFA reporting.
- Confounders cannot be separated.** Liquidity, scarcity, Fully Accessible Route and index eligibility, and the maturity segment’s own supply dynamics could each generate a 2 bps spread with no environmental preference involved. This analysis cannot distinguish a green preference from a scarcity premium and does not claim to.
- Impact is entirely unassessed.** No claim is made about emissions avoided. Government impact reporting is scheme-level and no attribution rule linking proceeds to a share of scheme output is published.
- Bid-to-cover data is patchy** and is reported only where verified.

Claims requiring further verification before they are relied upon

- Bids of ₹12,677 crore against ₹6,000 crore notified on 31 May 2024, currently sourced only to a secondary blog. Verify against the RBI auction result for that date.
- Exact greenium for the four FY2022-23 debut auctions, where press (5–6 bps) and Climate Bonds Initiative (2–3 bps) disagree. Verify against RBI full auction results and CCIL closing yields for the 7.38% GS 2027 and 7.26% GS 2032 on 25 January and 9 February 2023. India’s Sovereign Green Bonds, W. Sangwara, August 2026
- Greeniums for the 31 January 2025 and Q4 FY2024-25 auctions. Requires the DEA quarterly report for January–March 2025, Statement 1.

- All FY2025-26 auction outcomes, including whether any green bond was placed after 13 June 2025.
- Publication date of the FY2022-23 Impact Report, currently inferred from a filename only.
- Whether the ₹1,537.83 crore discrepancy in the FY2023-24 Allocation Report is an error or a definitional difference. The detailed table is treated as authoritative because it reconciles to the stated total.

Next steps to strengthen this analysis. In priority order: (1) same-day CCIL NDS-OM closing yields or the FBIL par yield curve for every comparator on all fifteen green auction dates, which would replace the interpolated column entirely; (2) RBI full auction results for every green auction, which would supply bid amounts and four-decimal cut-offs; (3) the outstanding DEA quarterly reports; (4) modified duration for each security at auction date, permitting a duration-adjusted greenium alongside the raw one. Where the two methods agree the finding strengthens; where they diverge, the divergence is itself worth reporting.
